

FGE FIVE-PRODUCT WORKFLOW MAP v1.0

The spine (shared by ALL five products — this is the whole secret)

Five products are NOT five pipelines. They are five renderers hanging off one spine. Build the spine once (done), and every product is a branch, every character is a pass-through.

Product 1 — WALL ART EDITION

Inputs	1 clean image master
Engine	fge_compositor —  BUILT
Output	2:3, 300 DPI, text-free
Channel	Gumroad — Wall tier (\$12)
Metric	Sales (the purest art-vs-market signal)

Product 2 — COLLECTOR POSTER

--	--

Inputs	Same master + canon JSON
Engine	fge_layout_v2 + fge_render —  BUILT
Output	Annotated artifact, edition-numbered
Channel	Gumroad — Collector tier (\$29)
Metric	Collector:Wall sales ratio (does lore convert?)

Product 3 — CODEX CARD

Inputs	Same master + canon JSON
Engine	fge_compositor card preset —  BUILT
Output	5:7 print-ready card
Channel	Bundled in Collector tier now; physical print run later
Metric	Mentions/requests (does the card want to be physical?)

Product 4 — LOOKBOOK

Inputs	6–10 approved editorial masters + canon JSON
Engine	Page renderer → PDF —  one pass via Surface Doctrine
Output	Paginated PDF, triple-shots + spreads + canon placards
Channel	Gumroad standalone (\$19–39) or premium tier
Build trigger	AFTER first listing returns data — not before

Product 5 — VIDEO DIARY read this one differently

Inputs	Approved clip masters (Grok video) + canon JSON
Engine	ffmpeg surface (title cards, lower-thirds from JSON) —  one pass

Output	9:16 Reel / TikTok, 1:1 feed cut
Channel	Instagram, TikTok — FREE, always
Metric	Follows, profile clicks, link-in-bio traffic

The correction: the Video Diary is not a SKU. It is the demand engine. Four products monetize. One product creates the audience the other four sell to. A 100-person firm has a marketing department; your marketing department is a renderer. Every character automatically ships with her own advertising — that, specifically, is how one person matches a firm. Selling the diary would starve the loop that feeds everything else.

Build order (locked)

1. **NOW:** Publish Lilith + Isolde listings (Products 1–3 are fully built; nothing is missing)
2. **Day 1–7:** Post triple-shot + social crops as the interim demand engine; measure
3. **After first data:** Build whichever of Product 4/5 the market signals — diary if traffic is the gap, lookbook if conversion is the gap
4. **Never:** Build 4 and 5 simultaneously while the store sits empty

The scale math (why this beats the shop of 50)

- Firm of 50: every character costs design hours × every product × every revision
- FGE: character #N costs 1 master generation + 15 min of JSON. All five products + listing + captions + codex render from it in under a minute.
- The firm's cost is linear in characters × products. Yours is linear in characters only. That asymmetry IS the business.
