

FGE-IDX-001 — Character Creation Source Index

Compiled: 2026-07-09 | **Instrument type:** Navigational index (non-authoritative — points to sources, rules nothing itself) | **Scope:** 6 uploaded artifacts, cross-referenced against the character-creation pipeline

This is a *pointer* document, not a merge. Each source below stays where it lives structurally; nothing here overrides the source's own status field. Purpose: let you find the right instrument fast and see how it connects to character creation without collapsing six different governance layers into one file.

INDEX TABLE

ID	Title	Layer / Dept	Status	Character-Creation Relevance
SRC-01	FGE Visual OS Consolidation Package	Governance Bureau · L5 Publishing Compiler	DRAFT — 4 rulings open (see below)	HIGH. Governs canon-lock gate that Character Genome Sheets, Archive Posters, and Dossiers must pass through before generation is trusted. Nothing downstream should build against this until Section 8 is ruled.
SRC-02	FGE Asset Judgment Console v1.0	Governance Bureau · Floor 2 System Vault	Active, self-contained	HIGH. Final KEEP / REFINE / DESTROY gate. Any finished character asset (e.g. a VERA-style Genome Sheet) should pass Gates 01–04 here before entering Archive.
SRC-03	VERA Gospel Genome Sheet (RAVEN-0426)	Character Division · L2–L3	Canonical, LOCKED, Gospel v7.9.1, Zero Drift Active	DIRECT. This <i>is</i> a finished character asset — the working exemplar of what Character_Genome / FGE-INF-004 produces once the pipeline is trusted end to end. Filed twice (duplicate upload).

SRC-04	Feral Gloss Quick Start Protocol (Vossa · Ice/Storm/Fire)	Marketing Armory · execution layer	Active, published-facing	MEDIUM-HIGH. This is the generation-execution SOP — Identity Lock + Gloss Physics + Director's Chair stack — that turns a locked character (like VERA) into output. Downstream of SRC-03, not a peer of it.
SRC-05	Template Building System (Product Blueprint v2.0)	Intelligence Directorate · L2 JSON contracts	Working reference schema	FOUNDATIONAL. The generic <code>FGEProduct</code> schema — its "Human Product" extension is the ancestor pattern behind any Character Seed / gospel JSON contract. Worth checking against your current Character Seed Specification for drift.
SRC-06	Building_infomanagement.docx (Campus BIM Spec script)	Governance Bureau · campus/infra layer	Production-ready utility, described not executed	LOW / INDIRECT. Campus Node-ID and port-connector conventions (POWER/DATA/AGENT/etc.) — not character-specific. Relevant only as a parallel ID-scheme precedent, since SRC-01 is independently trying to solve its own ID-scheme conflict.

FILING HYGIENE FLAG

Two of the six sources arrived as `untitled.pdf` / `_anonymous_.pdf` / `_anonymous__2.pdf` — no traceable filename. SRC-03 (VERA) is a confirmed duplicate across two of those anonymous files. Per your own provenance doctrine, an asset with no filename-level ID is the same class of problem SRC-01 is trying to solve at the archetype level — worth a pass to name/hash these on intake going forward.

CROSS-LINKS RELEVANT TO CHARACTER CREATION

- **SRC-01 → SRC-02 → SRC-03:** this is the intended pipeline order (classify/gate → judge → lock), but SRC-01 is not yet ruled, so SRC-03 currently exists as a locked asset with no ratified gate behind it. That's not a defect in VERA — it just means VERA predates the gate, not that she passed it.
 - **SRC-05 → SRC-03:** worth a direct diff. If the generic `Human Product / materialFingerprint` schema in SRC-05 has drifted from what SRC-03's actual gospel structure uses (fracture layer, wet physics, etc.), that's a silent schema fork.
 - **SRC-04 depends on SRC-03-class locks existing** — it's the consumer-facing execution layer for whatever character has already been gospel-locked. It shouldn't be read as a peer instrument to the governance sources above it.
 - **SRC-06 is the odd one out** — no direct character-creation dependency. Kept indexed only because it shares the ID-scheme problem SRC-01 is solving.
-

OPEN ITEM CARRIED FORWARD FROM SRC-01

Four Director rulings remain outstanding in the Visual OS package (canon-lock status on FGE-INF-001/005, archetype naming convention, ZONE_05–12 numbering conflict, single ID scheme). Until ruled, any *new* character Genome Sheet built after this index is technically being built without a locked gate behind it — same as VERA was, but now you'd be doing it knowingly rather than by precedent.
