

UNRATIFIED
PENDING
RECONCILIATION

The Commerce Compiler Codex

A record of the Commerce Compiler's evolution from manufacturing tool to enterprise operating architecture — held pending reconciliation against the ratified L0–L7 stack.

EVOLUTION V1.0 → V2.3 • CAPTURE • STRUCTURE • MULTIPLY • MEASURE • LEARN • GOVERN • COMPOUND

PROVENANCE & STATUS

Tag: SYNTHESIZED — compiled from source narrative, not verified against shipped code.

Gate status: Has not entered the four-gate canon-lock process. No SBID, no ratification stamp, no Canonical Decisions Register entry.

Blocking condition: Component names in this document collide with existing L0–L7 stub layers. See Reconciliation Punch List before this is read as canon.

EXECUTIVE SUMMARY

The Commerce Compiler began with one question: how does a canon object become a repeatable commercial ecosystem?

The first answer was simple — creative object becomes product package. The architecture that followed was not: creative intelligence into commercial ecosystem, into market learning, into predictive strategy, into autonomous

operations, into governed enterprise growth. What started as a manufacturing tool became an operating architecture for the whole enterprise.

MASTER SYSTEM LOOP

EVOLUTION VAULT

- COMMERCE COMPILER
- AGENT NETWORK
- CUSTOMER SIGNALS
- MARKET INTELLIGENCE
- PREDICTIVE ENGINE
- PORTFOLIO ALLOCATION
- EXECUTIVE COMMAND
- AUTONOMOUS OPERATIONS
- SELF OPTIMIZATION
- GOVERNANCE
- DIGITAL TWIN
- RESOURCE ORCHESTRATION

EVOLUTION ERAS

I

MANUFACTURING ERA

V1.0 — Product Generation Engine • V1.1 — Reliability Layer

JSON as contract, Python as execution — identity separated from behavior. V1.1 adds schema validation and Build Report Objects, giving the factory memory of its own manufacturing history.

II

MULTIPLICATION ERA

V1.2 — Product Family Spawning Engine

One canon object becomes an ecosystem. SKU doctrine locked:

FGE-[OBJECT_CODE]-[PRODUCT_TYPE]-[SEQUENCE] .

III

DISTRIBUTION ERA

V1.3 – Agent Execution Engine

The factory receives a workforce. A product isn't complete when it exists — it becomes valuable once it enters a controlled path toward discovery, conversion, collection, and feedback: specialized agents, SKU-to-campaign task routing, and market signals returned upstream.

IV

INTELLIGENCE ERA

V1.4 – Market Intelligence • V1.5 – Predictive Production

Claimed method: Bayesian optimization via Gaussian Process surrogate with Expected Improvement. The system moves from learning the past to forecasting the future — *unverified against implementation; flag for engineering audit before citation elsewhere.*

V

ENTERPRISE CONTROL ERA

V1.9-V2.3 – Self-Optimization • Governance • Simulation • Digital Twin • Resource Orchestration

The factory gains long-term memory governance, simulation capability, and enterprise-wide resource orchestration.

ANCHOR METHOD CONNECTION

①

Capture the core truth

2 Convert identity into structure

3 Multiply into an ecosystem

4 Learn from the world

5 Govern growth

6 Compound value forever

MASTER GLOSSARY

Evolution Vault

The internal memory system containing canon, identity, artifacts, and learned knowledge.

Product Compiler

Transforms creative objects into product families.

Commerce Compiler

Transforms products into market-ready packages.

Agent Network

Autonomous workers executing specialized functions. **Unmapped against Agent Orchestration stub layer — see punch list.**

Market Intelligence

External reality memory generated from customer behavior.

Predictive Engine

Forecasting system determining likely opportunities.

Portfolio Allocation

Strategic distribution of limited resources.

Resource Orchestration

The mechanism that directs energy toward maximum long-term value. **Unmapped**

against MAVEN — see punch list.

RECONCILIATION PUNCH LIST

Three named components in this codex share names or functional territory with layers already stubbed in the ratified L0–L7 stack. None are mapped. Resolve before this document is cited anywhere external.

UNRESOLVED • NAMING COLLISION Agent Network ↔ Agent Orchestration (L0–L7 stub) Determine whether these describe the same system under drifted terminology, or two distinct systems that both need to exist. No reconciliation without this being answered first.
UNRESOLVED • NAMING COLLISION Digital Twin (V2.2) ↔ Digital Twin (L0–L7 stub) Identical name, no shared spec. Confirm single source of truth before either reference is used in downstream documentation.
UNRESOLVED • NAMING COLLISION Resource Orchestration (V2.3) ↔ MAVEN (economic interface) Both claim the role of directing resources/value at the enterprise level. Overlap in function, not just name — highest-priority item on this list.
