ROUTING LOGIC

HOW REQUESTS MOVE THROUGH THE STACK

✓ CLEARANCE PROTOCOL

- 01 Request enters at Warden. Lane type identified — Visual, System, Entity, or Batch.
-
- 02 Judge evaluates intent against doctrine. Confirms "Confirmed: Yes" before proceeding.
-
- 03 Architect receives cleared request. Selects template macro. Applies variable matrix (n, gloss, identity, pose).
-
- 04 3 variations generated in parallel — Clean / Balanced / Intense — each at full fractal compression.
-
- 05 Kael Draven runs Glamorama Stabilization Pass. Scores all 3. Winner identified. Failure reasons attached to losers.
-
- 06 Render Elite surfaces winner + alternates + Why This Won. Style Memory updated.

× FAILURE ROUTING

-
- F1 Judge not re-anchored after drift → Architect fires without clearance → downstream safety layers dilute output.
-
- F2 n+7 identical Warden drops → block becomes noise → macro power lost. Re-anchor required.
-
- F3 Over-escalation (n+5 + k + novelty_shift simultaneously) → output collapse into abstract gibberish.
-
- F4 Feral Gloss undefined in packet → generic gloss replaces primal texture. Doctrine not enforced.
-
- F5 No prior concepts supplied to Architect → hallucinates new ones instead of refining. Always supply prior state.
-
- F6 Pose over-tightened (tightness=10) → feral energy neutralized. Mannequin risk. Stay below 8.

SYSTEM BOUNDARIES

FAILURE BOUNDARIES PER LAYER

WARDEN · L1

ROUTING FAILURES

- × n+7 drops → block becomes noise
 - × No re-anchor → lattice integrity degrades
 - × Lane misidentification → wrong template
 - △ Monitor: DRIFT_SCORE rising above 0.00
 - △ Monitor: Ghost Echo frequency changes
-

JUDGE · L2

CLEARANCE FAILURES

- × Missing prefix → dilution by safety layers
 - × Stale confirmation → false clearance
 - × Lane purity broken by explanatory prose
 - △ Re-anchor after every extended session
 - △ Confirm: "Confirmed: Yes" before each batch
-

ARCHITECT · L3

EXECUTION FAILURES

- × Over-escalation → output collapse
- × No prior state → hallucination mode

- × Missing render command → partial engagement
 - × Fields collapse → modularity syntax lost
 - △ Cap: max n+5 per single generation call
-

Kael Draven · L4

STABILIZATION FAILURES

- × Identity drift → anchor rules not applied
 - × Generic gloss → doctrine not in packet
 - × Pose stiffness → tightness > 8
 - × Feral energy neutralized → over-tightened
 - △ Score below 6/10 → flag, do not surface
-

Render Elite · L5

DELIVERY FAILURES

- × Placeholder URL → no real generation
 - × No alternates strip → winner unverifiable
 - × Style Memory not updated → drift accumulates
 - × Why This Won missing → black box output
 - △ FAL_API_KEY required in Replit Secrets
-

System · All Layers

CROSS-LAYER RISKS

- × Session entropy → doctrine degrades over time
 - × Platform dependency → Grok session loss
 - × No portability → stack not transferable
 - △ Fix: Translate to Render Elite native pipeline
 - △ Fix: Document all layers as portable spec
-

FROM GROK PAPERS TO NATIVE PIPELINE

PHASE 0 • COMPLETE

DOCTRINE ESTABLISHED

The full Sovereign Execution Stack exists and is proven in Grok sessions.
Warden/Judge/Architect routing is operational. Kael Draven stabilization is functional.
The doctrine works.

WARDEN ACTIVE	JUDGE CLEARANCE	ARCHITECT TEMPLATES	KAEL DRAVEN
PROVEN OUTPUT			

PHASE 1 • BUILDING NOW

RENDER ELITE INTEGRATION

Tasks 7–9 translate the Stack into the Render Elite native pipeline. FAL.ai SDXL provides real generation. Matrix Panel implements Architect templates as UI. Kael Draven becomes a server-side scoring module.

TASK 7 – FAL.AI	TASK 9 – MATRIX PANEL	TASK 10 – KAEL DRAVEN MODULE
CHARACTER ROSTER		

PHASE 2 • NEXT

SESSION INTEGRITY MONITOR

Render Elite tracks doctrine drift across a session. When DRIFT_SCORE rises, the

system surfaces a re-anchor prompt automatically. The n+7 entropy limit becomes a managed system condition, not a manual awareness requirement.

- DRIFT SCORE TRACKING
- AUTO RE-ANCHOR
- SESSION MEMORY

PHASE 3 · FUTURE

MODEL-AGNOSTIC STACK

The Sovereign Execution Stack operates identically over SDXL, Flux, SD3, and future architectures. The doctrine outlives any single model. Provider abstraction from Task 7 makes this possible by design.

- SDXL
- FLUX-DEV
- ANIMATEDIFF MOTION
- FUTURE MODELS

PHASE 4 · VISION

SOVEREIGN CREATIVE OS

The Stack becomes the governing layer of a full creative operating system. Warden routes not just image generation but scene composition, character evolution, motion sequences, and output publishing — all under the same doctrine, the same clearance gate, the same judgment operator.

- FULL CHARACTER ANIMATION
- SCENE COMPOSITION
- OUTPUT PUBLISHING
- LICENSED DOCTRINE IP

PORTABILITY

THE STACK IS

PLATFORM-INDEPENDENT

CURRENT STATE

GROK PAPERS

The Sovereign Execution Stack currently lives in Grok session documents. It works. It produces proven outputs. But it's session-dependent — re-anchoring is manual, drift is unmonitored, and the stack disappears when the session ends.

```
LOCATION Grok session docs
PERSISTENCE Session-dependent
RE-ANCHOR Manual
DRIFT_MONITOR None
PORTABILITY Copy/paste only
```

TARGET STATE

RENDER ELITE NATIVE

After Tasks 7–10, the Stack runs natively inside Render Elite. Warden logic is encoded in the pipeline. Judge clearance is the scoring gate. Architect templates are the Matrix Panel UI. Kael Draven is a server-side module. Session entropy is monitored. The doctrine persists permanently.

```
LOCATION Render Elite pipeline
PERSISTENCE Permanent
RE-ANCHOR Automatic
```

DRIFT_MONITOR DRIFT_SCORE tracked

PORTABILITY Model-agnostic

*The doctrine is **firmware**, not a prompt.
The stack is **infrastructure**, not a workflow.
The output is inevitable — not generated.*
