

MRK — Morph Reality Kernel (v1.0)

Unified system packet: Replit logic engine + UE5 transformation system + monetization strategy.

1. System Overview

MRK is a state-based transformation engine where entities shift form based on environment, intent, and identity stability.

2. Core Architecture

Three-layer system: Replit (logic), UE5 (execution), Market (monetization).

REPLIT → decision logic (n+5, n+4, n+3)

UE5 → real-time morph + gameplay

MARKET → plugins, games, API

3. MRK Core Logic

```
def MRK(entity, context):  
    form = select_form(context)  
    entity = map_identity(entity, form)  
    entity = execute_transform(entity, form)  
    return {"form": form, "entity": entity}
```

4. UE5 Integration Model

UE5 handles real-time morphing via skeletal mesh swaps, animation blending, and AI behavior changes triggered by MRK output.

Player Action → MRK Engine → Form Output → Mesh Swap → Behavior Change

5. Replit Role

Replit serves as the simulation brain for MRK, testing transformation logic and output states before engine integration.

6. Monetization Strategy

Three paths: UE5 plugin, indie game release, or AI simulation API service.

Plugin: \$25–\$150 per license
Game: \$5–\$30 per copy
API: subscription or usage-based

7. MVP Definition

Minimum viable system: 1 entity, 2 forms, 1 environment trigger, 1 transformation output.

Human → Wolf transformation demo
with stability + behavior shift output
