

The sultry elite; expensive-filthy-vibe addiction

Overview

This document describes a layered system for generating reproducible character and infographic architectures that function as both creative output and structured design logic.

1. Character Kernel Layer

Identity core system defining stable traits, visual invariants, emotional signature, narrative role, and non-negotiable constraints. This is the reproducibility anchor.

2. Prompt Genome Layer

Structured generation engine composed of modular blocks: subject definition, material language, lighting physics, camera logic, and style signature.

3. Material Symbolism Layer

Visual metaphor system including fractured marble, kintsugi gold repair logic, labradorite interference effects, subsurface scattering skin behavior, and hyperreal tactile depth encoding.

4. Composition Logic Layer

Graph-based visual structure defining node hierarchy, relational edges, emphasis weighting, and spatial organization such as radial or hierarchical layouts.

5. Intent Layer

Meta-system defining purpose: certification readiness, reproducibility validation, modular expansion capability, monetization readiness, and system legitimacy signaling.

Reproducible Template

Character_Kernel + Prompt_Genome + Material_Symbolism + Composition_Graph + Intent_Tag = Fully reproducible visual system instance.
